(a) Adiabatic operation
(b) Heat exchange with constant $T_{a}$
(c) Co current heat exchange
(d) Counter current heat exchange
(e) For parts (c) and (d), plot $\mathrm{Q}_{\mathrm{r}}$ and $\mathrm{Q}_{\mathrm{g}}$ down the length of the reactor. What do you observe?

## Selectivity

If one were to write $S_{C / D}=F_{C} / F_{D}$ in the Polymath program, Polymath would not execute because at $\mathrm{V}=0$, $\mathrm{F}_{\mathrm{C}}=0$ resulting in an undefined volume (infinity) at $\mathrm{V}=0$. To get around this problem we start the calculation $10^{-4}$ $\mathrm{dm}^{3}$ from the reactor entrance where $\mathrm{F}_{\mathrm{D}}$ will not be zero and use the following IF statement.
(15) $\quad \tilde{S}_{C / D}=$ if $(V>0.001)$ then $\left(\frac{F_{C}}{F_{D}}\right)$ else (0)

## Selectivity

3) Stoichiometry:
