## Pressure Drop in PBRs

Concentration Flow System: $\quad C_{A}=\frac{F_{A}}{v}$

Gas Phase Flow System:

$$
v=v_{0}(1+\varepsilon X) \frac{T}{T_{0}} \frac{P_{0}}{P}
$$

$$
C_{A}=\frac{F_{A}}{v}=\frac{F_{A 0}(1-X)}{v_{0}(1+\varepsilon X) \frac{T}{T_{0}} \frac{P_{0}}{P}}=\frac{C_{A 0}(1-X)}{(1+\varepsilon X)} \frac{T_{0}}{T} \frac{P}{P_{0}}
$$

$$
C_{B}=\frac{F_{B}}{v}=\frac{F_{A 0}\left(\Theta_{B}-\frac{b}{a} X\right)}{v_{0}(1+\varepsilon X) \frac{T}{T_{0}} \frac{P_{0}}{P}}=\frac{C_{A 0}\left(\Theta_{B}-\frac{b}{a} X\right)}{(1+\varepsilon X)} \frac{T_{0}}{T} \frac{P}{P_{0}}
$$

## Pressure Drop in PBRs

Note: Pressure Drop does NOT affect liquid phase reactions
Sample Question:
Analyze the following second order gas phase reaction that occurs isothermally in a PBR:

$$
A \rightarrow B
$$

## Mole Balances

Must use the differential form of the mole balance to separate variables:

$$
F_{A 0} \frac{d X}{d W}=-r_{A}^{\prime}
$$

Rate Laws
Second order in A and irreversible: $-r_{A}{ }^{\prime}=k C_{A}^{2}$

## Pressure Drop in PBRs

Stoichiometry

$$
C_{A}=\frac{F_{A}}{v}=C_{A 0} \frac{(1-X)}{(1+\varepsilon X)} \frac{P}{P_{0}} \frac{T_{0}}{T}
$$

Isothermal, $\mathrm{T}=\mathrm{T}_{0} \quad C_{A}=C_{A 0} \frac{(1-X)}{(1+\varepsilon X)} \frac{P}{P_{0}}$

Combine:

$$
\frac{d X}{d W}=\frac{k C_{A 0}^{2}}{F_{A 0}} \frac{(1-X)^{2}}{(1+\varepsilon X)^{2}}\left(\frac{P}{P_{0}}\right)^{2}
$$

Need to find $\left(P / P_{0}\right)$ as a function of W (or V if you have a PFR)

## Pressure Drop in PBRs

Constant mass flow: $\quad \dot{m}=\dot{m}_{0}$

$$
\begin{gathered}
\rho v=\rho_{0} v_{0} \\
\rho=\rho_{0} \frac{v_{0}}{v} \\
v=v_{0} \frac{F_{T}}{F_{T 0}} \frac{P_{0}}{P} \frac{T}{T_{0}} \\
v=v_{0}(1+\varepsilon X) \frac{P_{0}}{P} \frac{T}{T_{0}}
\end{gathered}
$$

## Pressure Drop in PBRs

Variable Density $\quad \rho=\rho_{0} \frac{P}{P_{0}} \frac{T_{0}}{T} \frac{F_{T 0}}{F_{T}}$
$\frac{d P}{d z}=\frac{-G}{\rho_{0} g_{c} D_{p}}\left(\frac{1-\phi}{\phi^{3}}\right)\left[\frac{150(1-\phi) \mu}{D_{p}}+1.75 G\right] \frac{P_{0}}{P} \frac{T}{T_{0}} \frac{F_{T}}{F_{T 0}}$

Let

$$
\beta_{0}=\frac{G}{\rho_{0} g_{c} D_{p}}\left(\frac{1-\phi}{\phi^{3}}\right)\left[\frac{150(1-\phi) \mu}{D_{p}}+1.75 G\right]
$$

## Pressure Drop in PBRs

Catalyst Weight $\quad W=z A_{c} \rho_{b}=z A_{c}(1-\phi) \rho_{c}$
Where $\quad \rho_{b}=$ bulk density
$\rho_{c}=$ solid catalyst density
$\phi=$ porosity (a.k.a., void fraction)
$(1-\phi)=$ solid fraction
$\frac{d P}{d W}=\frac{-\beta_{0}}{A_{c}(1-\phi) \rho_{c}} \frac{P_{0}}{P} \frac{T}{T_{0}} \frac{F_{T}}{F_{T 0}}$
Let $\quad \alpha=\frac{2 \beta_{0}}{A_{c}(1-\phi) \rho_{c}} \frac{1}{P_{0}}$

## Pressure Drop in PBRs

$$
\frac{d y}{d W}=-\frac{\alpha}{2 y} \frac{T}{T_{0}} \frac{F_{T}}{F_{T 0}} \quad y=\frac{P}{P_{0}}
$$

We will use this form for single reactions:

$$
\frac{d\left(P / P_{0}\right)}{d W}=-\frac{\alpha}{2} \frac{1}{\left(P / P_{0}\right)} \frac{T}{T_{0}}(1+\varepsilon X)
$$

$$
\frac{d y}{d W}=-\frac{\alpha}{2 y} \frac{T}{T_{0}}(1+\varepsilon X)
$$

$$
\frac{d y}{d W}=-\frac{\alpha}{2 y}(1+\varepsilon X)
$$

## Pressure Drop in PBRs

$$
\frac{d X}{d W}=\frac{k C_{A 0}^{2}(1-X)^{2}}{F_{A 0}(1+\varepsilon X)^{2}} y^{2}
$$

$$
\frac{d X}{d W}=f(X, P) \text { and } \frac{d P}{d W}=f(X, P) \text { or } \frac{d y}{d W}=f(y, X)
$$

The two expressions are coupled ordinary differential equations. We can only solve them simultaneously using an ODE solver such as Polymath. For the special case of isothermal operation and epsilon $=0$, we can obtain an analytical solution.
Polymath will combine the Mole Balances, Rate Laws and Stoichiometry.

## Packed Bed Reactors

$y^{2}=(1-\alpha W)$
$y=(1-\alpha W)^{1 / 2}$

## 4 Conversion in a PBR

## 5 Flow Rate in a PBR

$$
\begin{gathered}
v=v_{0}(1+\varepsilon X) \frac{P_{0}}{P} \frac{T}{T_{0}} \\
T=T_{0} \quad y=\frac{P_{0}}{P} \\
f=\frac{v_{0}}{v}=\frac{1}{(1+\varepsilon X) y}
\end{gathered}
$$
