

## E 5 Lewis Acids and Bases: Complexation

### 1. ACIDITY OF CATIONS (Part 1)

- Cations are Lewis acids and exist as aquo complex ions in aqueous solution.  
Example:  $[\text{Al}(\text{HOH})_6]^{3+}$ ,  $[\text{Cu}(\text{HOH})_4]^{2+}$
- Aquo Complex cations may react with water. During reaction proton/s is/are released from the aquo complex ion and bond to water molecule/s to form hydronium ions.  
Example:  $[\text{Cu}(\text{HOH})_4]^{2+} + \text{HOH} = [\text{Cu}(\text{HOH})_3(\text{OH})]^+ + \text{H} \cdot \text{HOH}^+$
- Acidic properties of cations in aqueous solution differ and are related to the position of the metal ion's element in the periodic table and its charge and charge density and resulting attraction for electrons (oxidizing agent strength)
  - **Lewis acid strength: Post-transition > transition > alkaline earth > alkali**  
(e.g.  $\text{Mg}^{2+}_{(\text{aq})}$  is better Lewis acid than  $\text{Na}^+_{(\text{aq})}$ ;  $\text{Al}^{3+}_{(\text{aq})}$  is better Lewis acid than  $\text{Mg}^{2+}_{(\text{aq})}$ )
  - **Lewis acid strength is related to charge density of the cation**  
(e.g.  $\text{Mg}^{2+}_{(\text{aq})}$  has greater charge density than  $\text{Ca}^{2+}$  since the ionic radius of the former is smaller than the latter and thus  $\text{Mg}^{2+}_{(\text{aq})}$  is more acidic than  $\text{Ca}^{2+}$ .)
  - **As period # decreases within a family, acid strength of cation increases:**  
(e.g.  $\text{Mg}^{2+}_{(\text{aq})}$  is more acidic than  $\text{Ca}^{2+}_{(\text{aq})}$ )

### 2. LEWIS ACID-BASE REACTIONS.

- Lewis acids = electron pair seekers (such as cations) react with (coordinate to) a Lewis base = electron pair donor.
- Lewis bases are also called ligands.
- Lewis acid-base reactions are also called complexation reactions.
- Lewis acid-base reactions are equilibrium systems.

### 3. RXN OF AQUO COMPLEX CATIONS WITH LEWIS BASES (Part 2)

- A Lewis *acid* (base) reacts with (bonds to) the BEST Lewis *base* (acid) and therefore Ligand/base exchange may occur

- Reaction extent (i.e. equilibrium point) of aquo complex cations is related to the position of the cation's element in the Periodic Table and its Lewis acid strength.
  - Reaction extent differs with different bases (e.g.  $\text{OH}^-$  vs.  $\text{NH}_3$ ) and is predictable from the position of the cation's element in the Periodic Table.
    - **Class data shows only transition cation's reacted extensively with  $\text{NH}_3$ .**\*
- Example:  
 $[\text{Ni}(\text{H}_2\text{O})_6]^{2+}$  is green in aqueous solution. If  $\text{NH}_3$  is added, violet  $[\text{Ni}(\text{NH}_3)_6]^{2+}$  is formed. The post-transition cation  $\text{Pb}^{2+}$  ( $[\text{Pb}(\text{H}_2\text{O})_4]^{2+}$ ) does not react with  $\text{NH}_3$ , but instead reacts with  $\text{OH}^-$  present in the ammonia solution to form a

hydroxide ppt. ( $[\text{Pb}(\text{H}_2\text{O})_2(\text{OH})_2]$ ). There is a small concentration of  $\text{OH}^-$  ions in the basic ammonia solution.

\*Note: When  $\text{NH}_3$ , is added to any solution containing a cation and reaction occurs, the product  $[\text{M}(\text{NH}_3)_x]^{x+}$  will always be charged (the same as the reacting metal ion) and soluble (since  $\text{NH}_3$  has no charge). If a precipitate forms upon addition of ammonia to a solution containing a cation, you may conclude that it is likely a hydroxide ppt. due to reaction with the small amount of  $\text{OH}^-$  ions in the ammonia,

- **Class data shows only post-transition cation's reacted extensively with  $\text{OH}^-$ .**

Note: When cations react with  $\text{OH}^-$ , the cation product's charge and solubility alter as it bonds to the charged hydroxide ion.

Example: Reaction of  $\text{OH}^-$  ions with aquo complex metal ions:

Cation Family	Example	Primary Class Observations
<b>I</b>	$[\text{Na}(\text{HOH})_6]^+$ (lousy Lewis acids; equilibrium pt. far left)	<b>no reaction</b>
<b>II</b>	$[\text{Ca}(\text{HOH})_6]^{2+}$ (weak Lewis acids; rxn does not proceed to any great extent)	<b>ppt.</b> $[\text{Ca}(\text{HOH})_4(\text{OH})_2]$ <b>or no change</b> $[\text{M}(\text{HOH})_5(\text{OH})]^+$
<b>Transition</b>	$[\text{Co}(\text{HOH})_6]^{2+}$  # (Cation with unfilled d electron subshell).	<b>solution color change# or ppt.</b> $[\text{Co}(\text{HOH})_5(\text{OH})]^+ \dots [\text{Co}(\text{HOH})_4(\text{OH})_2]$
<b>PostTrans.</b>	$[\text{Pb}(\text{HOH})_4]^{2+}$ (strong Lewis acids; equilibrium pt. far right)	<b>ppt. forms</b> $[\text{Pb}(\text{HOH})_2(\text{OH})_2]$ <b>and dissolves</b> $[\text{Pb}(\text{OH})_4]^{2-}$

#### 4. COMPLEXATION AND SOLUBILITY EQUILIBRIA (Part 3).

- Dissolving of precipitates upon addition of base ( $\text{OH}^-$  or  $\text{NH}_3$ ) is predictable from the position of the cation's element in the periodic table.
- A precipitate (complex) will dissolve upon addition of  $\text{OH}^-$  or  $\text{NH}_3$  if the cation comprising the ppt. reacts with the added base to form a soluble complex ion:
  - A ppt. containing a transition metal ion will likely dissolve upon addition of  $\text{NH}_3$ .
  - A ppt. containing a post-transition metal ion will likely dissolve upon addition of  $\text{OH}^-$  (e.g., upon addition of  $\text{NaOH}$ ).
  - A ppt. containing a metal ion other than transition or post-transition will NOT dissolve upon addition of  $\text{OH}^-$  or  $\text{NH}_3$ .

<u>Cation</u>	<u>Primary Observation</u>	<u>Interpretation</u>
<b>II</b>	ppts. did NOT dissolve	Cations = weak Lewis acids (i.e. <b>do not react extensively with OH<sup>-</sup> or NH<sub>3</sub></b> )
<b>Trans.</b>	ppts. dissolve in NH <sub>3</sub>  <i>some</i> dissolve in NaOH.	<b>Trans. cations react (bond) well to Lewis base NH<sub>3</sub></b> and convert to soluble ammine complex ion. Some cations reacted with OH <sup>-</sup> to form a soluble hydroxo complex ion. Most do not react extensively with OH <sup>-</sup> and therefore the ppt. does not dissolve.
<b>Post-trans.</b>	ppts. dissolve in OH <sup>-</sup> ppts. do NOT dissolve in NH <sub>3</sub>	<b>Post trans. cations react extensively with OH<sup>-</sup></b> and ppts tend to dissolve as metal ion converts to a soluble hydroxo complex ion. Post trans.cations do NOT react well with NH <sub>3</sub> .

## QUESTIONS EXPERIMENT 5 (LEWIS ACIDS AND BASES)

### Part 1. Acidity of Cations and the Periodic Table

1. The aquated form of the  $\text{Cd}^{2+}$  ion is  $\text{Cd}(\text{H}_2\text{O})_6^{2+}$ . When  $\text{CdCl}_2(\text{s})$  is added to water (pH 7), the pH drops to about pH 5 and the aqueous solution remains clear. Write a balanced equation that supports the observations. Include only the reactants and not spectator ions.

2. You have solutions of 0.10 M  $\text{CaCl}_2$ ,  $\text{NiCl}_2$ , and  $\text{GaCl}_3$ . Arrange these in order of *decreasing* pH values:

highest pH		lowest pH
_____	>	_____
	>	_____

(now try Dec'04, 4A-B, April'05, 1A; Dec.05, 1B, 2A, April'06, 4A; Dec.06, 1B-C; April'07, 1B)

### Part 2 Acid-Base Reactions and Complexation

3. **Circle** any compound that is soluble in water and is likely to form a hydroxide precipitate that dissolves upon addition of 1M NaOH.

KNO <sub>3</sub>	Ba(NO <sub>3</sub> ) <sub>2</sub>	Pb(NO <sub>3</sub> ) <sub>2</sub>
------------------	-----------------------------------	-----------------------------------

4. Concentrated NaOH is added dropwise to a solution of 0.1M  $\text{ZnCl}_2$ . After 5 drops a cloudy white precipitate forms. The precipitate dissolves after the addition of 15 drops. What is the principal zinc containing species in solution after the addition of 15 drops of NaOH?

Circle the white precipitate formed after the addition of 5 drops of NaOH:

[Zn(H <sub>2</sub> O) <sub>4</sub> ] <sup>2+</sup>	[Zn(OH) <sub>4</sub> ] <sup>2-</sup>	[Zn(H <sub>2</sub> O) <sub>2</sub> (OH) <sub>2</sub> ]	[Zn(H <sub>2</sub> O) <sub>2</sub> (Cl) <sub>2</sub> ]
--	--------------------------------------	--	--

Circle the species present after the addition of 15 drops of NaOH:

[Zn(H <sub>2</sub> O) <sub>4</sub> ] <sup>2+</sup>	[Zn(OH) <sub>4</sub> ] <sup>2-</sup>	[Zn(H <sub>2</sub> O) <sub>2</sub> (OH) <sub>2</sub> ]	[Zn(H <sub>2</sub> O) <sub>3</sub> (OH)] <sup>+</sup>
--	--------------------------------------	--	---

- 5.

**Circle** any 0.10 M solution that forms a precipitate that dissolves upon addition of 1.0 M  $\text{NH}_3$ .

CaCl <sub>2</sub>	NiCl <sub>2</sub>	GaCl <sub>3</sub>
-------------------	-------------------	-------------------

**Question 6** deals with your investigations of the Lewis acid-base interactions of the metal ions  $\text{Cu}^{2+}$ ,  $\text{Co}^{2+}$ ,  $\text{Cd}^{2+}$ , and  $\text{Ca}^{2+}$ . Below are your experimental data:

Aquo Complex Ion	REAGENT	REAGENT + 5M NaOH	REAGENT + 5M $\text{NH}_3(\text{aq})$
$[\text{Cu}(\text{H}_2\text{O})_4]^{2+}$	$\text{Cu}(\text{NO}_3)_2$ clear, blue	blue-white ppt.	blue-white ppt. $\rightarrow$ ppt. dissolves clear, prussian blue.
$[\text{Co}(\text{H}_2\text{O})_6]^{2+}$	$\text{Co}(\text{NO}_3)_2$ clear, rose	rose-red ppt.	rose-red ppt. $\rightarrow$ ppt. dissolves clear, yellow
$[\text{Cd}(\text{H}_2\text{O})_4]^{2+}$	$\text{Cd}(\text{NO}_3)_2$ clear, colorless	white ppt. $\rightarrow$ ppt. dissolves clear, colorless	white ppt. $\rightarrow$ ppt. dissolves clear, colorless
$[\text{Ca}(\text{H}_2\text{O})_4]^{2+}$	$\text{Ca}(\text{NO}_3)_2$ clear, colorless	white ppt.	white ppt.

- A. Based on the above data which one or more of the cations  $\text{Cu}^{2+}$ ,  $\text{Co}^{2+}$ ,  $\text{Cd}^{2+}$ , and  $\text{Ca}^{2+}$  can act as a Lewis acid and complex with the Lewis base,  $\text{NH}_3$ ?

**Circle** any cation that acts as a Lewis acid and complexes with the Lewis base  $\text{NH}_3$ .

$\text{Cu}^{2+}$                    $\text{Co}^{2+}$                    $\text{Cd}^{2+}$                    $\text{Ca}^{2+}$

- B. According to the above data, the addition of 5  $\text{NH}_3$  to  $\text{Co}(\text{NO}_3)_2$  results ultimately in a “clear, yellow” solution. Identify the principal cobalt species in the “clear, yellow” solution.

**Circle** the principal cobalt containing species in the clear yellow solution:

$[\text{Co}(\text{H}_2\text{O})_6]^{2+}$      $[\text{Co}(\text{OH})_6]^{4-}$      $[\text{Co}(\text{NH}_3)_6]^{2+}$      $[\text{Co}(\text{OH})_2(\text{NH}_3)_4]$

(try Dec'04, 3, April'05, 1C, 3A; Dec.05, 2, 5; April 2006, 4B, 4C; Dec.06, 6; April'07, 1D, 4A)

### Part 3 Complexation & Solubility Equilibria

#### 6. (continued)

- C. In another experiment, you precipitate  $\text{Co}(\text{OH})_2$ ,  $\text{Cd}(\text{OH})_2$ , and  $\text{Ca}(\text{OH})_2$ . Based **upon the above observations**, which *one or more* of these precipitates will dissolve upon addition of 5M NaOH?

**Circle** any precipitate which will dissolve upon addition of 5M NaOH or circle “NONE”:

$\text{Co}(\text{OH})_2$                    $\text{Cd}(\text{OH})_2$                    $\text{Ca}(\text{OH})_2$                   NONE

(Try Dec'04, 4C-D, 5A#3; April'05, 3; Dec.05,7; April'06, 1D, 4C; Dec.06, 1B, 2C#2; April'07, 1C, 4B, 5B1)
