Show Changes Between Versions

This option allows the user to compare the current version of the application against a previous version, which is selected from the drop-down menu.

Note that this option does not display a cumulative history of changes between versions. It only compares the current version (for example, v4.0) against the selected version (for example, v1.0) and displays any differences between the two: in this example, changes made in versions 2.0 and 3.0 would not be displayed.

Changed Steps

This option allows the user to select a specific page of the application where changes were made. Only pages where changes were made will display in the drop-down menu. Directional buttons allow you to navigate through the pages in order.

Note that often an individual change to the application can be viewed on more than one of the pages listed. For example, ALL changes made to Species, Location Information, Procedure Summary, Adverse Consequences and Use Justification pages can be viewed by selecting any ONE of those pages in the Changed Steps menu.

Differences

Specific changes to the application are listed here. Click the arrow next to each item in order to view the change in more detail. Information that was changed or added is highlighted in green, and old values for changed information or information that was deleted is highlighted in red.
