The Global Impact of HIV/AIDS on Youth

May 2002

While HIV/AIDS has always been an epidemic of young people, current trends indicate that this may well be but the tip of the iceberg. The current impact is expected to worsen, with projected numbers of people living with HIV/AIDS in hard hit countries rising steadily over the next two decades.1

CURRENT & PROJECTED IMPACT

HIV/AIDS prevalence among young people is already high in many countries around the world, and young people continue to make up a significant proportion of new infections:

- There are an estimated 40 million people living with HIV/AIDS worldwide, more than a third of whom (38%) are under the age of 25. Teens and young adults between the ages of 15 and 24 represent almost a third of the 40 million people living with HIV/AIDS.2
- Of the 5 million people newly infected with HIV in 2001, almost 6 in 10 (58%) were under the age of 25. Those in the 15-24 year old age group represented 4 in 10 of these new infections (see Figure 1). Young people ages 15-24 account for half of all new infections among adults ages 15-49. This amounts to almost 6,000 infections per day among 15-24 year olds, or approximately one every 15 seconds.2,3
- Most (77%) young people living with HIV/AIDS live in sub-Saharan Africa,4 as do over 90% of the world’s AIDS orphans (some 12.1 million children).5 About 15% of young people living with HIV/AIDS are in the East/South Asia and Pacific region of the world (see Figure 2).4,6
- High rates of HIV infection among young people are, for the most part, occurring in countries with very young populations. Over half the population of sub-Saharan Africa, for example, is estimated to be under 18 (with one in four between 10 and 19).4,7
- The confluence of high HIV/AIDS prevalence and disproportionately young populations results in a concentration of new infections among youth.

THE MOST VULNERABLE

Certain subpopulations of youth have been identified as bearing a disproportionate share of HIV’s proliferation and/or being at increasing risk:2

Young women and girls:
- Women comprise an increasing proportion of those living with HIV/AIDS, rising from 41% in 1997 to 47% in 2001.10,14,16 The rate of new infections among girls is as much as 5 to 6 times higher than those of boys in some hard hit countries3,14 and young women represent the majority of young people living with HIV/AIDS in sub-Saharan Africa and Asia (see Figure 2).2 Biologically, the risk of becoming infected with HIV during unprotected vaginal intercourse is greater for women than men6 and on average, women are infected at younger ages than men.8

Young men who have sex with men (MSM):
- Stigma, social exclusion, and lack of information can result in increased risk-taking among men who have sex with men.6,17 Male-to-male sexual transmission is a predomi-
niant risk factor for HIV in several countries, including the U.S., Brazil, Costa Rica, and Mexico, and may be playing an increasing role in Eastern Europe.6,14 Risky behaviors and HIV infection rates among young MSMs may again be on the rise in the developed world.6,18-21

Injection drug users (IDU):
- Injection drug use continues to be a risk factor for many young people, particularly in Eastern Europe, Central Asia, and the Russian Federation.6,22

Children orphaned by AIDS:
- An estimated 13.2 million children—most of whom live in the developing world—have lost their mothers or both parents to AIDS,5 a number that could rise to 44 million by 2010.25 Without support systems and resources, they are at substantially increased risk of malnutrition, abuse, illness—and HIV infection.5

Sexually-exploited children:
- Prostitution, trafficking, child pornography and forced marriages all bring increased likelihood of HIV infection for the children and the communities within which such practices occur.23 Approximately 1 million children enter the world’s sex trade every year,7 placing them at greater risk for HIV infection.24 Rates of HIV infection among young sex workers can be high.10,12,15,16,24

CONCLUSION
The impact of the epidemic on young people is expected to grow, particularly in hard hit countries which already have very young populations. Therefore, the level of available resources and how resources are used will continue to challenge global and national leaders.3,31 Prevention interventions directed at youth will be critical to altering the future course of the epidemic.
