Release 11.0.1

DESIGN SUMMARY: Variances will be computed using the Taylor Linearization Method, Assuming a With Replacement (WR) Design

Sample Weight: NCSRWTSH
Stratification Variables(s): SESTRAT
Primary Sampling Unit: SECLUSTR

Number of zero responses : 383867

Number of non-zero responses : 1829

Independence parameters have converged in 7 iterations.

Number of observations read : 415219 Weighted count: 415607
Observations in subpopulation : 385696 Weighted count: 386866
Observations used in the analysis : 385696 Weighted count: 386866
Denominator degrees of freedom : 42

Maximum number of estimable parameters for the model is 12

File C10_EXPANDED1 contains 84 Clusters
84 clusters were used to fit the model
Maximum cluster size is 9268 records
Minimum cluster size is 1168 records

Sample and Population Counts for Response Variable MDETV
Based on observations used in the analysis
0: Sample Count 383867 Population Count 385087
1: Sample Count 1829 Population Count 1779

R-Square for dependent variable MDETV (Cox & Snell, 1989): 0.002700

-2 * Normalized Log-Likelihood with Intercepts Only : 22635.38
-2 * Normalized Log-Likelihood Full Model : 21592.41
Approximate Chi-Square (-2 * Log-L Ratio) : 1042.97
Degrees of Freedom : 11

Note: The approximate Chi-Square is not adjusted for clustering.
Refer to hypothesis test table for adjusted test.
