

## CHAPTER 5 ASDA ANALYSIS EXAMPLES REPLICATION-SPSS/PASW V18 COMPLEX SAMPLES

### GENERAL NOTES ABOUT ANALYSIS EXAMPLES REPLICATION

These examples are intended to provide guidance on how to use the commands/procedures for analysis of complex sample survey data and assume all data management and other preliminary work is done. The relevant syntax for the procedure of interest is shown first along with the associated output for that procedure(s). In some examples, there may be more than one block of syntax and in this case all syntax is first presented followed by the output produced.

In some software packages certain procedures or options are not available but we have made every attempt to demonstrate how to match the output produced by Stata 10+ in the textbook. Check the ASDA website for updates to the various software tools we cover.

### NOTES ABOUT DESCRIPTIVE ANALYSES IN SPSS/PASW V18 COMPLEX SAMPLES MODULE

SPSS/PASW DESCRIPTIVE/TABULATE/RATIO commands can perform nearly all of the descriptive analyses presented in Chapter 5 of ASDA. Some of the fine points of these procedures are the use of a SUBPOP statement for subpopulation analyses, various output statistics specified on the STATISTICS subcommand, and use of an analysis Plan file for all Complex Samples commands. The plan file should be prepared prior to working with any Complex Samples commands and offers the ability to declare weights and design variables to the program. The DESCRIPTIVES/TABULATE commands do not include the ability to perform linear contrasts for difference between means but this can be done through the use of the linear regression command CSGLM and are demonstrated for examples 5.12 and 5.13. Finally, complex sample survey corrected quantiles are not included in SPSS v18 therefore not included in this chapter.

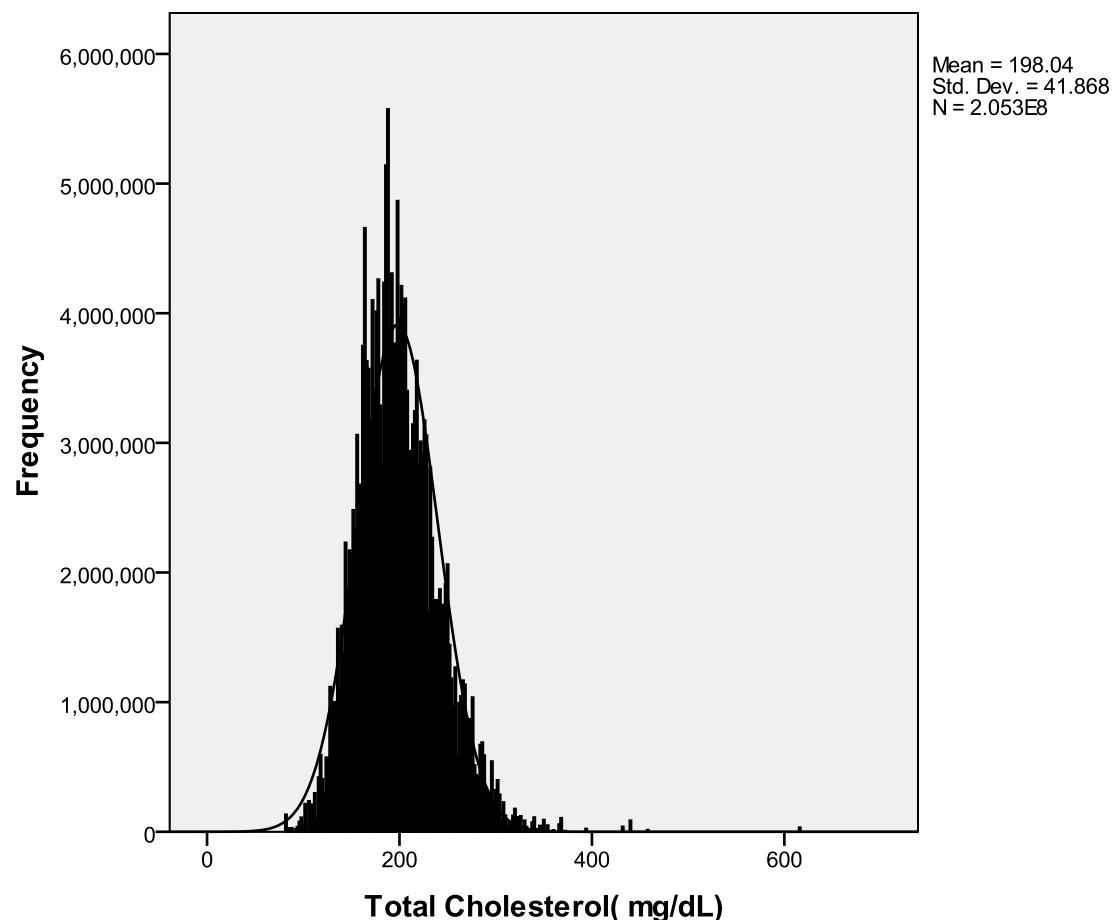

Analysis Example 5.1

Warning # 3211

On at least one case, the value of the weight variable was zero, negative, or missing. Such cases are invisible to statistical procedures and graphs which need positively weighted cases, but remain on the file and are processed by non-statistical facilities such as LIST and SAVE.

GRAPH

/HISTOGRAM(NORMAL)=LBXTC.

Cases weighted by Full Sample 2 Year MEC Exam Weight

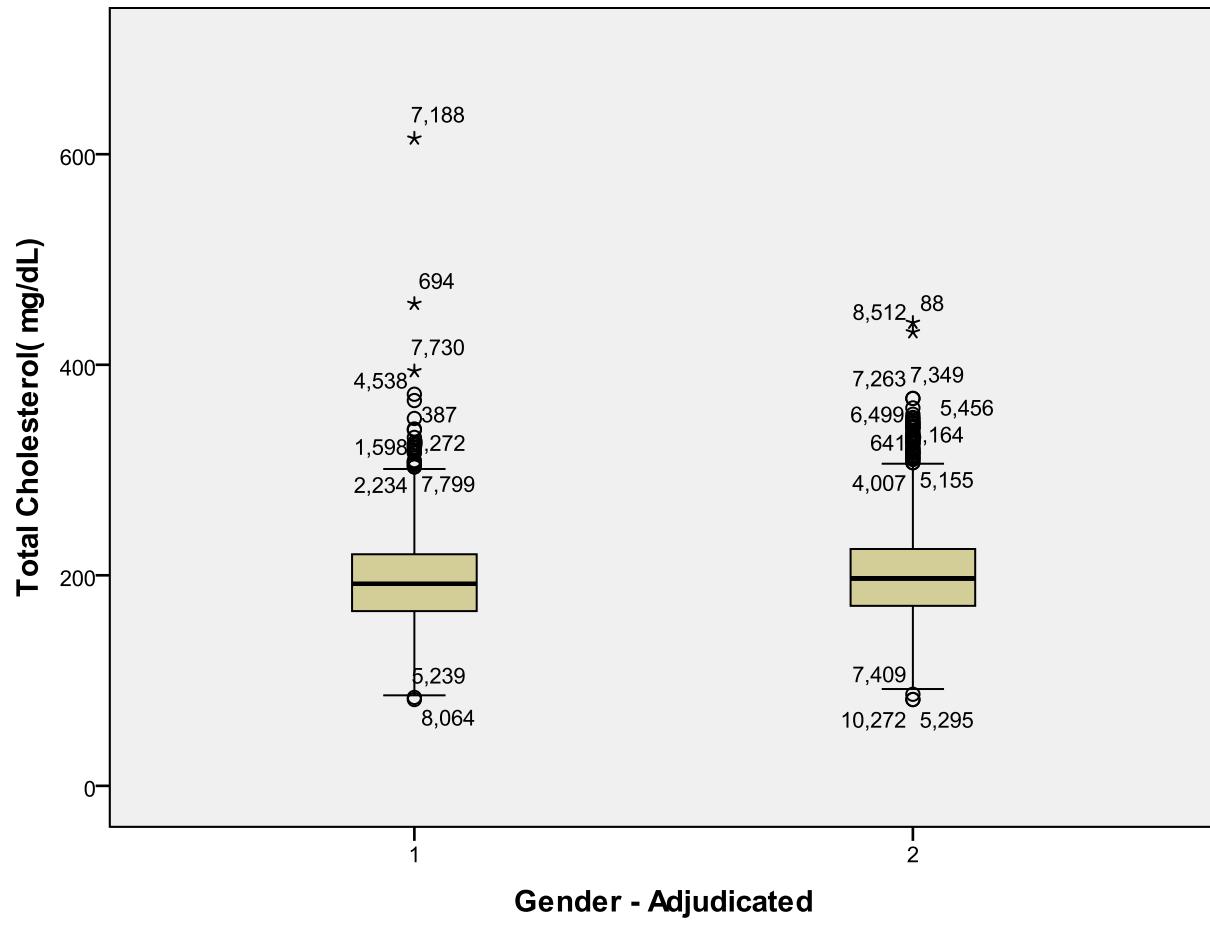

\*Analysis Example 5.2

Warning # 3211

On at least one case, the value of the weight variable was zero, negative, or missing. Such cases are invisible to statistical procedures and graphs which need positively weighted cases, but remain on the file and are processed by non-statistical facilities such as LIST and SAVE.
